

# Energy Modeling Parser — UI Guide

The guided project flow, section by section. Each page: the UI (left), a tooltip (top), and what it does (right).

**1 Basic Info****2 Utility Rates****3 Model****4 Project Analysis****5 Excel****6 Report**

**TOOLTIP**

Capture everything about the project up front — location, certification, building type & weather file. Opens as a **locked popup** on “New Project” (won’t close on an outside click).

## 1 • Basic Info

### UI

**Basic Info**

### INFORMATION

#### What it does

- One place for all project metadata; pre-fills later steps.
- **Pincode** → **Locate** resolves **City / State / Country** as separate dropdowns and stores coordinates for rate sourcing.
- **Building type** is the AIA / Zero Tool list (also free-typed) and drives the benchmark EUI.
- **Rating system** includes an **NA** option; version & type are free-text.
- **Weather File** lists the nearest 5 real EPW files (DOE index) with name, type (TMY/TMY3) & distance; the **Download** button pulls the whole station bundle as a **.zip**.
- Model type is *not* chosen here — it’s detected when parsing (step 3).

popup on New Project

no outside-click close

editable in step 1

**TOOLTIP** Auto-source **electricity, gas, carbon & water** rates with citations from the project's pincode. Each rate's **View** opens its **Project Utility Profile**.

INFORMATION

### What it does

- Address is inherited from Basic Info — one **Locate & source rates** button fills every rate.
- **Find** pulls values from EIA / NREL URDB / Cambium / eGRID; a **Sources** popup lists every option with its full citation, highlights the one **in use**, and never truncates the text.
- Typing a rate manually requires a **source name + link** before it's accepted.
- **View** shows that utility's gradient **Project Utility Profile**: green (US-lowest) → yellow (US-avg) → red (US-highest), with dashed US/State-average lines and a solid local line. Value labels auto-stack so they never overlap.
- **Export PPT** writes the profile as **editable native shapes** (not an image).

electricity

gas

carbon

water

**TOOLTIP**

Upload & parse the energy model, then complete **setup** (model assignment + AIA info + QA/QC) inline — no popup. Parsing is locked until rates are set in step 2.

**PROCESS LOADS?**

Yes ▾

**MODEL TYPE (EXTRACTED)**

trace

☐ Model includes adjacent shading structures

### INFORMATION

#### What it does

- Parses eQUEST (.SIM/.inp) or TRACE (PDF) into normalized baseline & proposed rows.
- Parse is gated** — you must select utility rates in step 2 first.
- The old setup **popup is gone**; its fields are inline and must be completed to unlock Excel.
- Utility-rate inputs are hidden here (already set in step 2). Project info is trimmed to **Gross Floor Area**; the old “Baseline information” is now **AIA information**.
- QA/QC** pre-fills Author = signed-in user and Date = today; **process loads**, the **extracted model type**, and the **adjacent-shading** toggle sit beneath the uncertainty factor.

AI search (collapsed)

logs (collapsed)

**TOOLTIP**

Baseline-vs-proposed dashboards — **EUI, energy, carbon & cost** — computed from the parsed models. Its own step between Model and Excel.

## 4 • Project Analysis

### UI

### INFORMATION

#### What it does

- Promoted out of the Model step into its **own 4th section** so results get a dedicated view.
- Charts EUI, total energy, operational carbon & energy cost — identical layout for every model type.
- Reads directly from the parsed rows + the utility rates.

**TOOLTIP**

Builds the **Energy Results Comparison** workbook (.xlsx) from the parsed models, utility rates & project info.

## 5 • Excel

### UI

#### Generate the Excel workbook

Energy Results Comparison (.xlsx)

↓ Generate & download Excel

### INFORMATION

#### What it does

- One click builds the comparison workbook and downloads it; it's also handed to the report step.
- Field mapping follows the revamp — removed/moved inputs simply leave their cells blank.
- The old **Supporting uploads** panel has been removed.

**TOOLTIP**

Auto-fills the formatted **Energy Model Report (.docx)** from the workbook and the project details.

## 6 • Report

### UI

#### Energy Results Report

Uses the step-5 Excel + the report fields — no re-upload needed.

↓ Generate Word report

### INFORMATION

#### What it does

- Merges project metadata (client, location, certification, phase, weather) and the comparison results into the narrative .docx.
- Pulls the Excel generated in step 5 automatically; an upload still overrides it.
